Research Agenda

My research develops quantitative models that translate health-preference evidence into policy decisions, with emphasis on decision analysis, simulation modeling, and cost-effectiveness. I integrate discrete choice experiments (DCEs), structural econometrics, and computational simulation—including agent-based frameworks—to evaluate how interventions, incentives, and behavioral constraints shape health outcomes at population scale. My current work extends these methods to generative AI: I build and validate LLM-based synthetic agents that can simulate patient and provider behavior for health policy modeling, and I audit how model value orientations bias predicted policy effects. This agenda sits at the intersection of health technology assessment, decision science, and machine learning, and is oriented toward models that inform clinical guidelines and resource allocation in both domestic and global settings.

Working Papers

1. “**Empirical-Frontier Regularization for LLM Synthetic Agents: A Preference-Anchored Framework**”
Working Paper (Target: Value in Health) — [SSRN Link](#). Introduces a DCE-grounded empirical-frontier regularization framework for LLM synthetic agents. Using a convex anchoring rule ($\pi = \lambda\pi_{\text{LLM}} + (1 - \lambda)P_{\text{static}}$), the Static-BDT Anchor reduces waiting-time monotonicity violations from 62.5% to 4.2% and improves Spearman rank correlation from -0.024 to 0.952 . Presented at AIE Summer Conference 2026 and DAISY 2026 (ACM CHIL 2026).

2. **“Value Contamination in Policy Simulation: Measuring How LLM Policy-Value Orientations Shape Predicted Administrative Burden Effects”**

Target: Health Services Research — [SSRN Link](#). Develops an audit framework for measuring value sensitivity in LLM-generated policy simulations. Using administrative burden in vaccination access as a testbed, evaluates nine LLMs across six model families through policy-value orientation batteries, narrative frame-decomposition, and within-model frame-manipulation experiments.

3. **“Waiting Time as a Behavioral Barrier to Vaccination Uptake: Nonlinear Heterogeneity by Institutional Trust”**

Under Review at Economic Analysis and Policy — [Link to Full Draft](#)

- Developed a structural Discrete Choice Experiment (DCE) framework to analyze the interaction between temporal barriers and institutional trust in vaccination behavior.
- Identified nonlinear heterogeneity in waiting time sensitivity, providing a behavioral explanation for vaccine hesitancy.

4. **“The Price of Waiting: Evidence on Cash–Time Trade-Offs in Vaccination Time Discount”**

Manuscript in Preparation (Expected submission: August 2026) — Targeting *Social Science & Medicine*.

Research Experience & Affiliations

Doctoral Researcher, Spatial Health AI Research Partnership (SHARP), UT Dallas

- Leading interdisciplinary research on the intersection of artificial intelligence, geospatial analytics, and health policy.
- Managing large-scale datasets and developing computational simulations (R, Python) to evaluate pandemic preparedness.
- Leading development of the Behavioral Digital Twin (BDT) framework, integrating DCE data with causally-constrained LLM agents for synthetic policy simulation—an individual-level, agent-based approach to simulating health decisions at scale.

Graduate Researcher, Behavioral Health Economics Laboratory, UT Dallas

- Conducted high-salience behavioral experiments (N=1,027) analyzing risk-weighted health decisions and institutional trust.

Teaching Experience

Teaching Assistant, School of Economic, Political and Policy Sciences, UT Dallas

- **Quantitative Methods for Policy Analysis (Graduate):** Led Econometrics labs; specialized in R programming, regression analysis, and causal inference.
- **Health Economics & Public Policy (Undergraduate):** Developed case studies on health market failures and administrative challenges.
- **Public Policy Analysis (Undergraduate):** Mentored students in drafting evidence-based policy memos.

Conference Presentations

- **Invited Talk, Duke University PrefER Confab** (August 2026, Durham, NC): Empirical-Frontier Regularization for LLM Synthetic Agents in Vaccination Preference Research.

- **AI and Economics (AIE) Summer Conference 2026:** Empirical-Frontier Regularization for LLM Synthetic Agents.
- **APPAM Fall Research Conference 2025** (Seattle, WA): Estimating Time Discount Rate for Vaccination.
- **DAISY 2026 Workshop at ACM Conference on Health, Inference, and Learning (CHIL) 2026:** Behavioral Digital Twins — A Causally-Faithful Generative Framework.
- **UT Dallas Graduate Research Symposium 2025:** Modeling Vaccination Decisions with Hyperbolic Discounting.

Honors & Awards

- **2025** Dean of Graduate Education Dissertation Research Award, UT Dallas
- **2025** Betty & Gifford Johnson Graduate Travel Award, UT Dallas
- **2016** Omicron Delta Epsilon, International Honor Society for Economics

Technical Skills & Certifications

Simulation & Decision Modeling: Agent-Based Modeling (BDT, LLM agents), Microsimulation-oriented design, SEIR Epidemic Modeling, Decision Trees, Cost-Effectiveness Analysis.

Econometrics: Mixed Logit (MXL), Latent Class Models (LCM), Causal Inference, Structural Estimation.

AI & ML: PyTorch, Transformers (HuggingFace), LLM APIs (OpenAI, Anthropic), LangChain, RAG, Causal Machine Learning, Generative AI for HEOR.

Software: Python, R, Stata (Advanced), MATLAB, LaTeX, SQL, GIS.

Certifications: Stanford Artificial Intelligence Graduate Certificate; CITI Human Subjects Protection.
